

# Fingerprinting the Climate System

Ben Santer

Woods Hole Oceanographic Institution  
and UCLA

University of Utah  
Oct. 4, 2023

# My background

---

- **My job:** Atmospheric scientist
- **My education:** U.K. and Germany
- **My research:** Climate fingerprinting
- **My hobby:** Rock-climbing

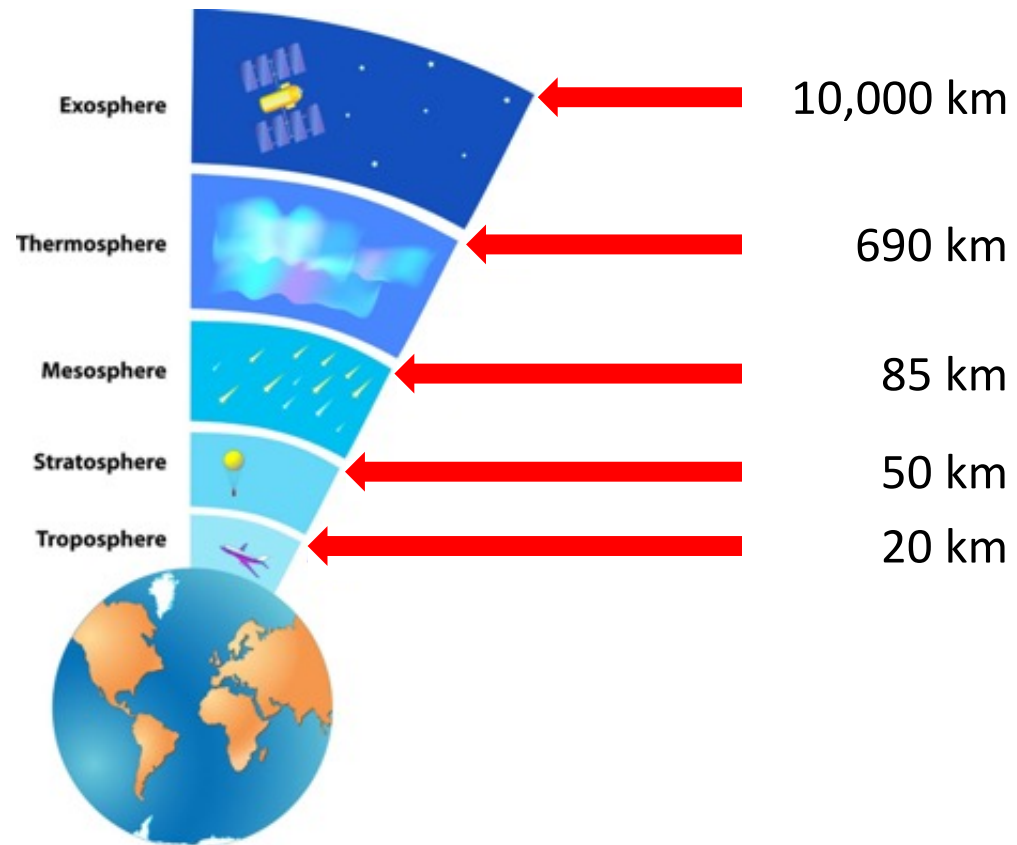

# Basics

---

- Climate is influenced by:
  - Natural factors (the Sun, volcanoes, internal variability)
  - Human factors (greenhouse gases, particulate pollution, land surface changes)
- Climate fingerprinting seeks to disentangle natural and human factors

# Basics: Different layers of Earth's atmosphere

# Structure

---

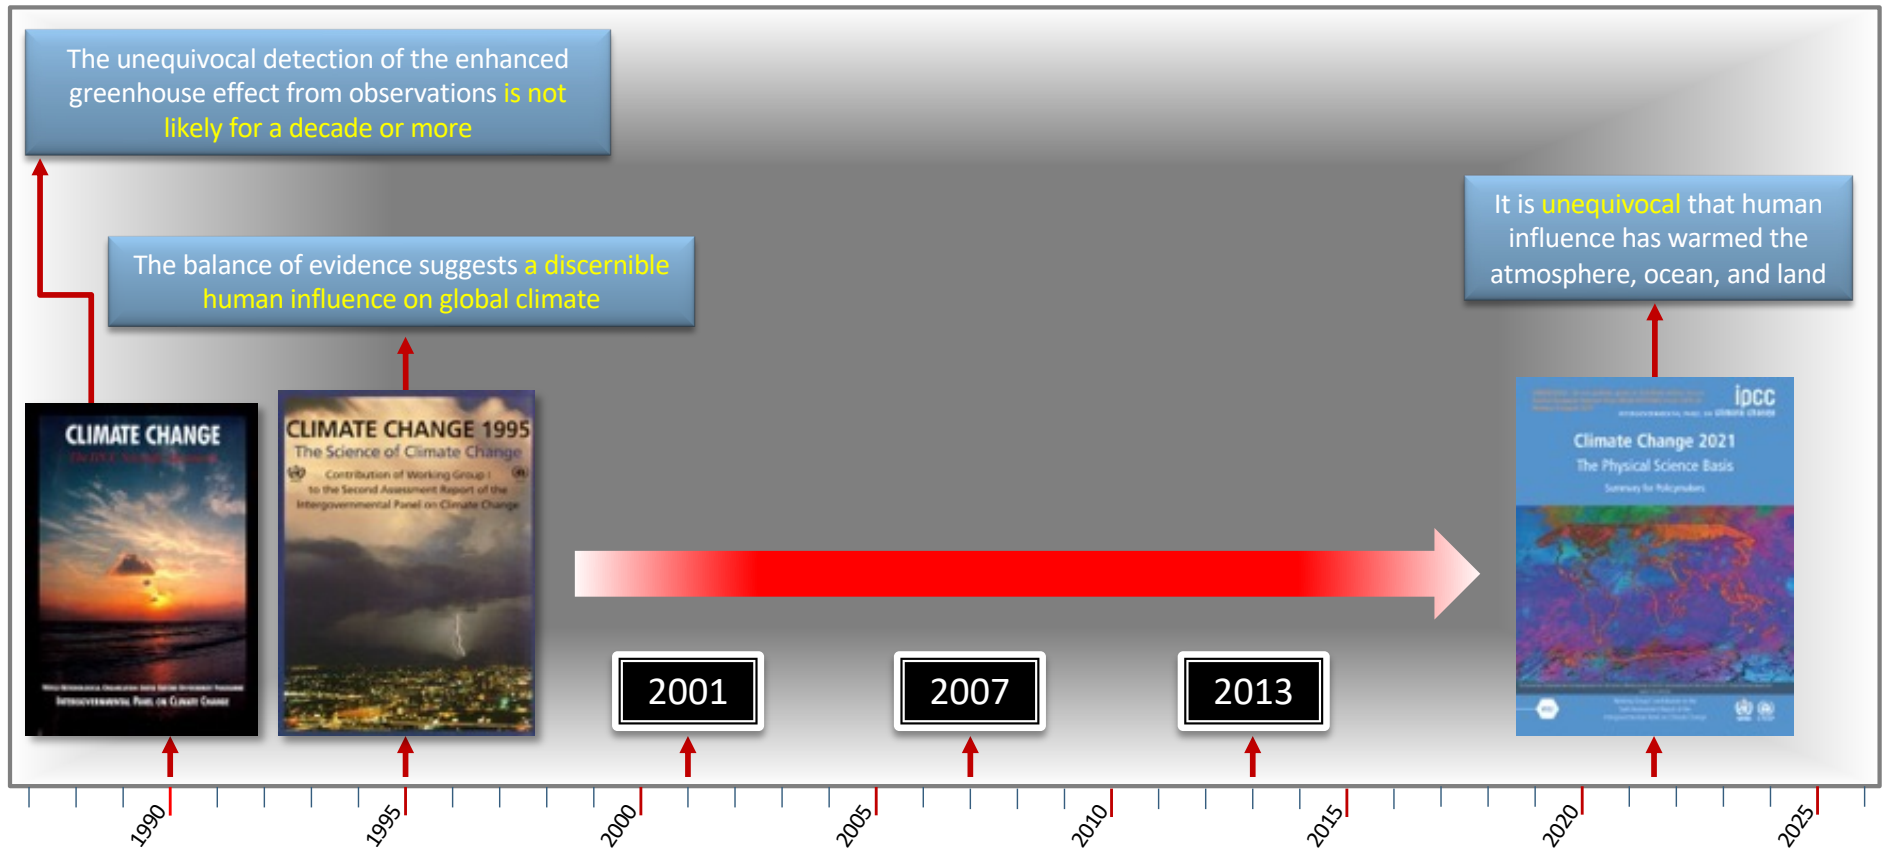

- Climate fingerprinting 101
- Fingerprinting and the 2021 Nobel Physics Prize
- Fingerprinting example
- Looking at the causes of changes in extreme events
- Lessons learned

# Structure

---

- **Climate fingerprinting 101**
- Fingerprinting and the 2021 Nobel Physics Prize
- Fingerprinting example
- Looking at the causes of changes in extreme events
- Lessons learned

# The arc of history

# “Climate fingerprinting” contributed to this arc of history

---

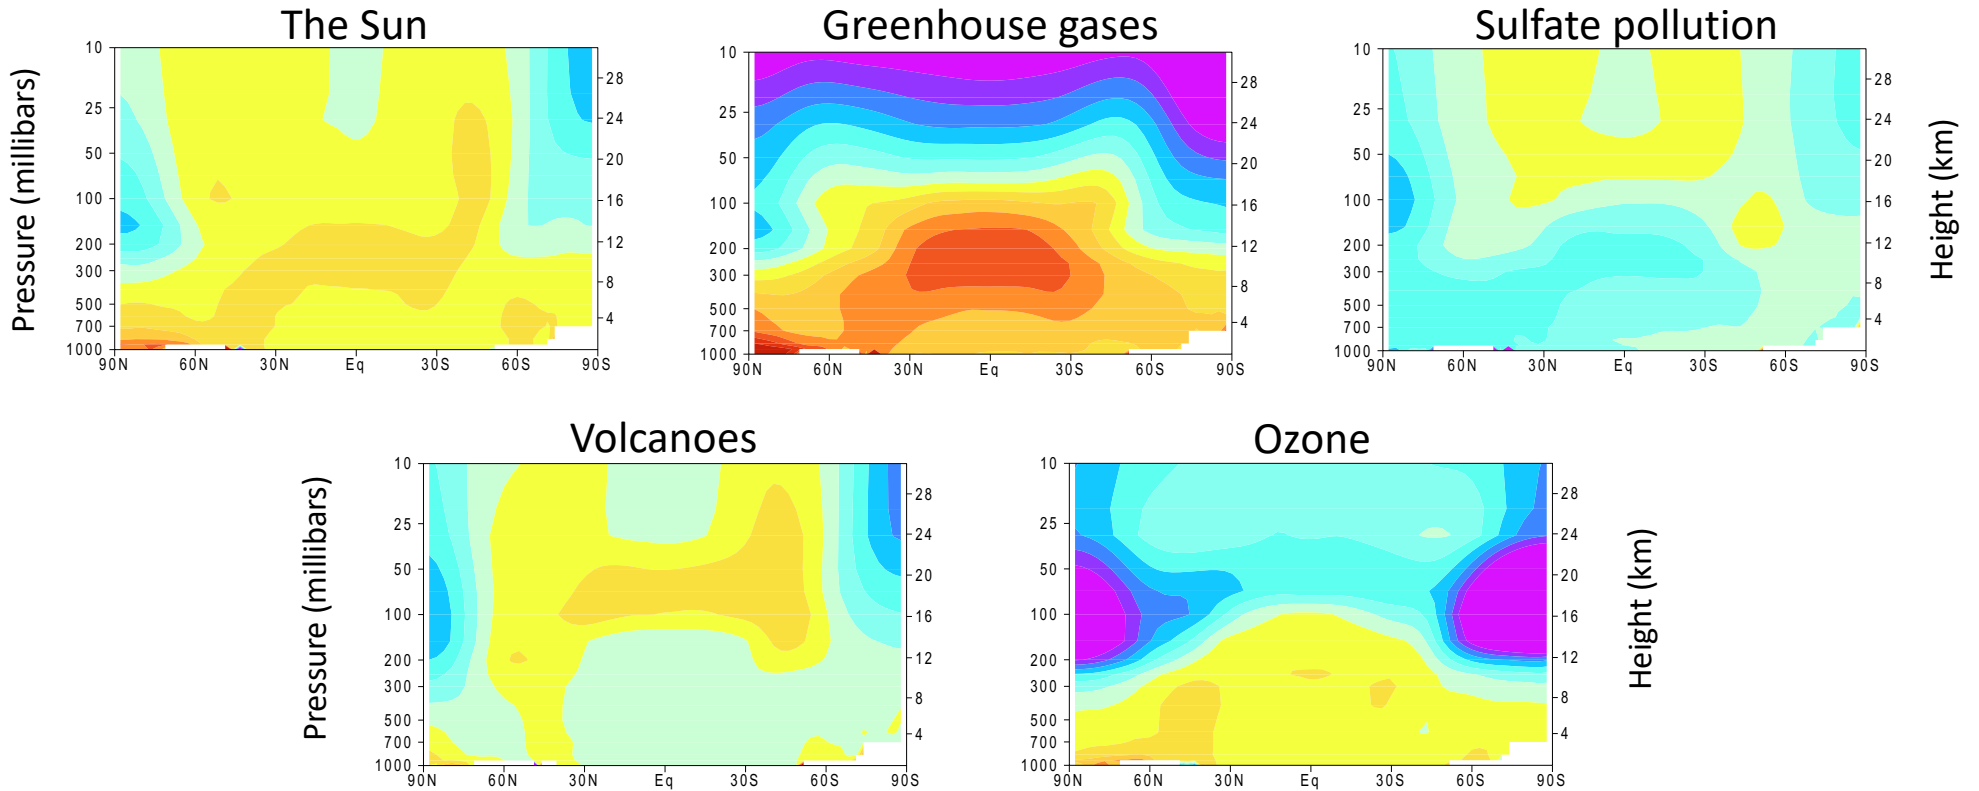

- Basic idea:

- Different influences on climate have different signatures
- Signatures are easier to discern in patterns (“fingerprints”)

# Natural and human fingerprints on climate

# Structure

---

- Climate fingerprinting 101
- **Fingerprinting and the 2021 Nobel Physics Prize**
- Fingerprinting example
- Looking at the causes of changes in extreme events
- Lessons learned

# Hasselmann: The power of patterns

---

## 2021 Nobel Physics Prize

Awarded for developing:

“...methods for identifying specific signals, fingerprints, that both natural phenomena and human activities imprint in the climate”

# Hasselmann: The power of patterns

# What was Hasselmann's key insight?

Human fingerprint

# Manabe: Using models to understand the real-world climate system

---

## **2021 Nobel Physics Prize**

Awarded for:

“...the physical modelling of Earth's climate, quantifying variability and reliably predicting global warming”

# Manabe and Wetherald, 1967

## Thermal Equilibrium of the Atmosphere with a Given Distribution of Relative Humidity

SYUKURO MANABE AND RICHARD T. WETHERLAND

*Geophysical Fluid Dynamics Laboratory, ESSA, Washington, D.C.*

(Manuscript received 2 November 1966)

# Structure

---

- Climate fingerprinting 101
- Fingerprinting and the 2021 Nobel Physics Prize
- **Fingerprinting example**
- Looking at the causes of changes in extreme events
- Lessons learned

# Could all surface warming be due to the Sun?

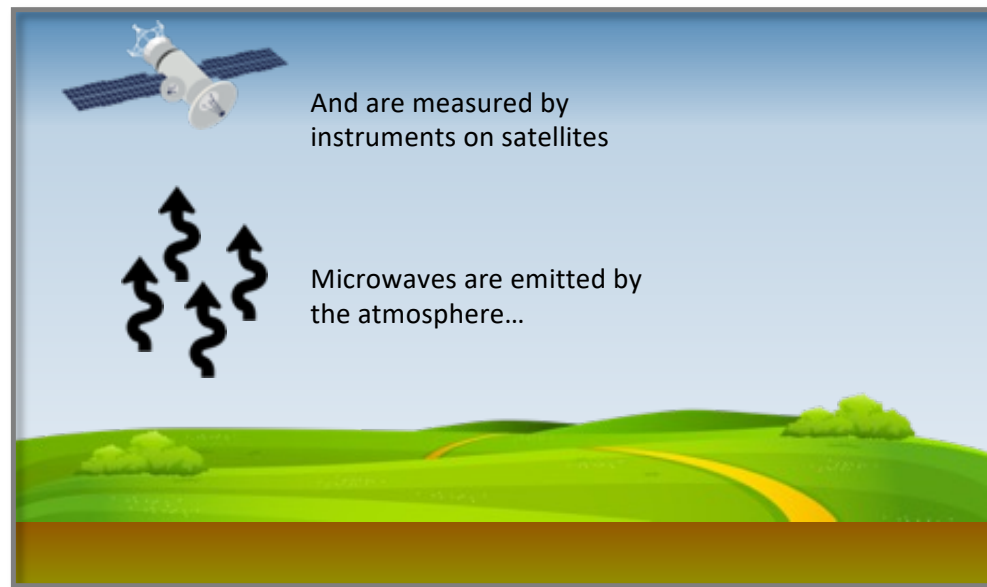

**"It's all the Sun"**

Testing claims that the surface warming of the last 170+ years is all due to changes in the Sun

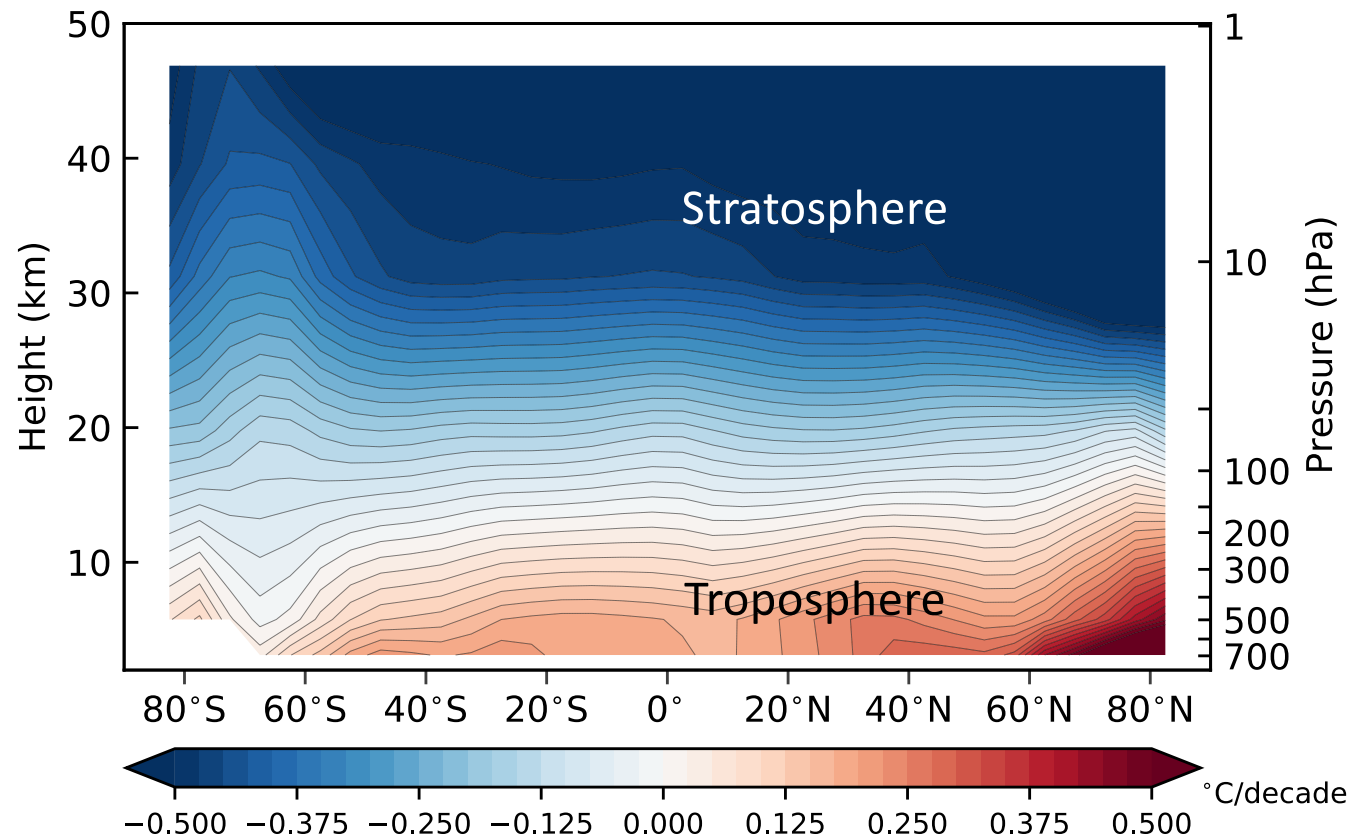

# Measuring atmospheric temperature from space

- Higher temperatures = More microwave emissions from oxygen molecules
- By choosing different microwave frequencies, different atmospheric layers can be measured

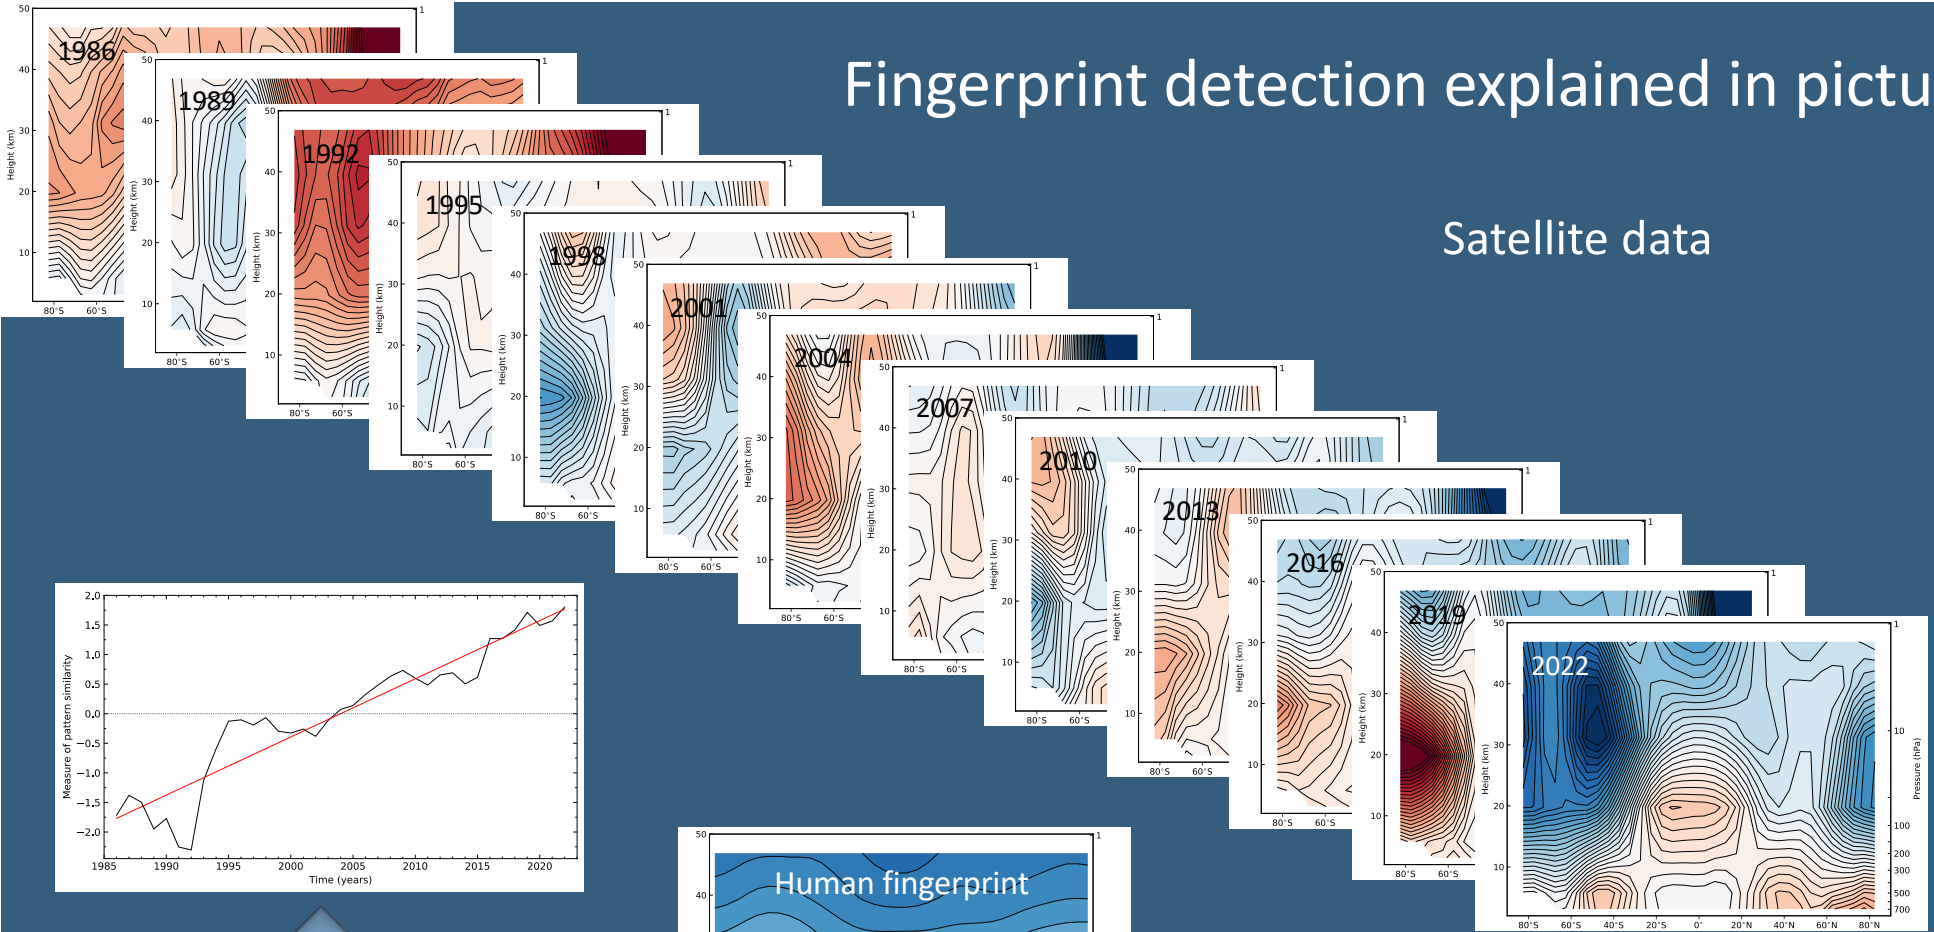

# Satellite temperature data show the atmospheric temperature fingerprint predicted by Manabe

Temperature trend over  
1986 to 2021

# Fingerprint detection explained in pictures

Satellite data

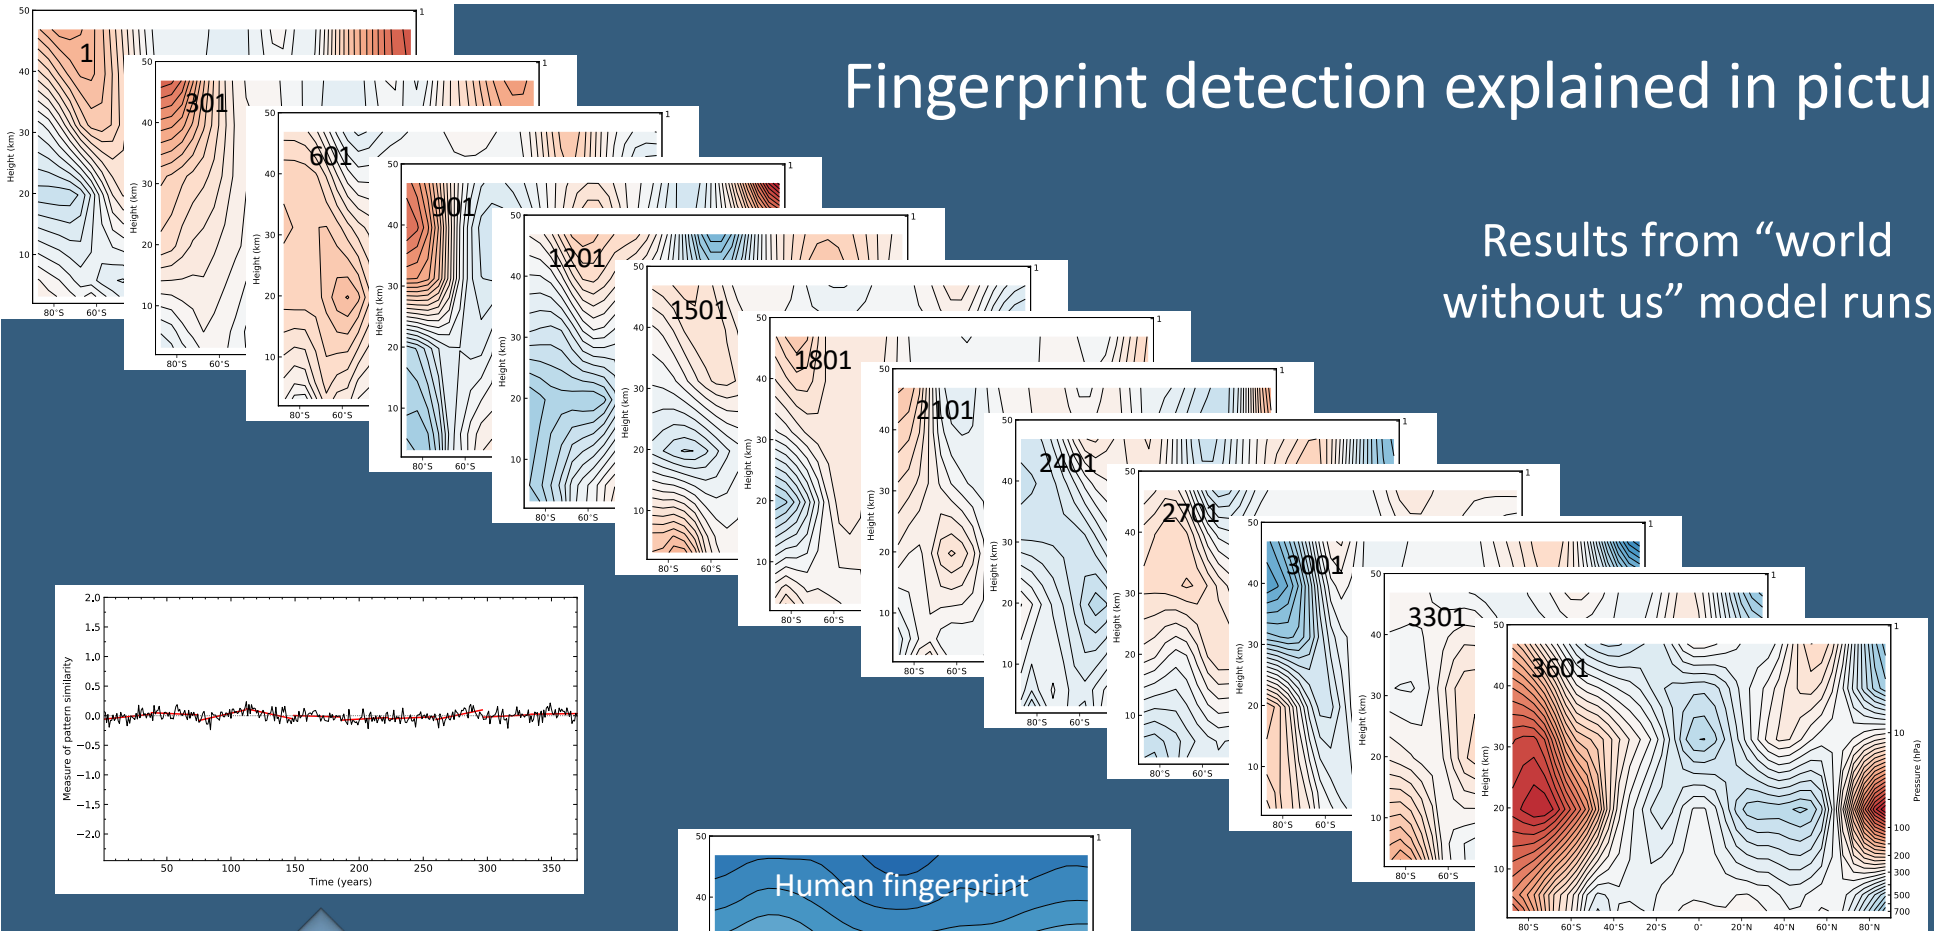

Generate pattern similarity time series

Compare with fingerprint

# Fingerprint detection explained in pictures

Results from “world without us” model runs

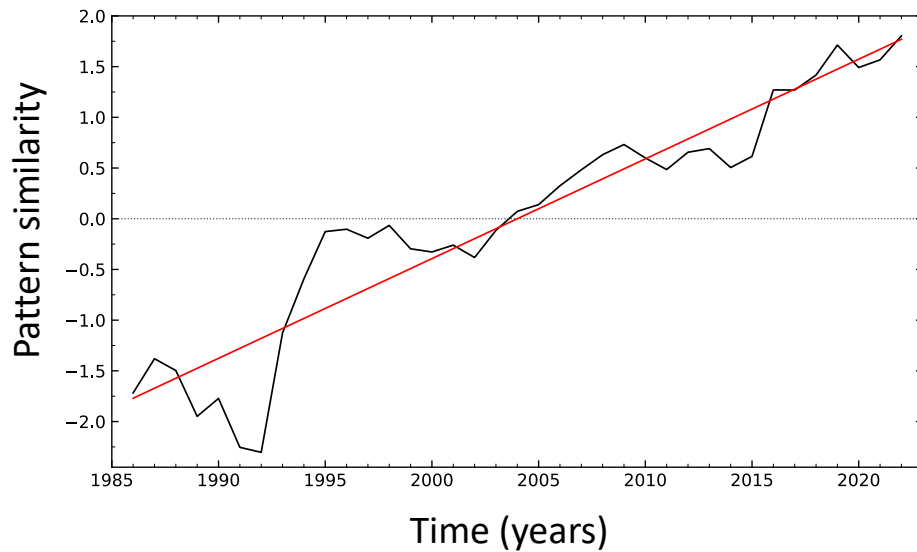

Compare with fingerprint

Generate pattern similarity time series

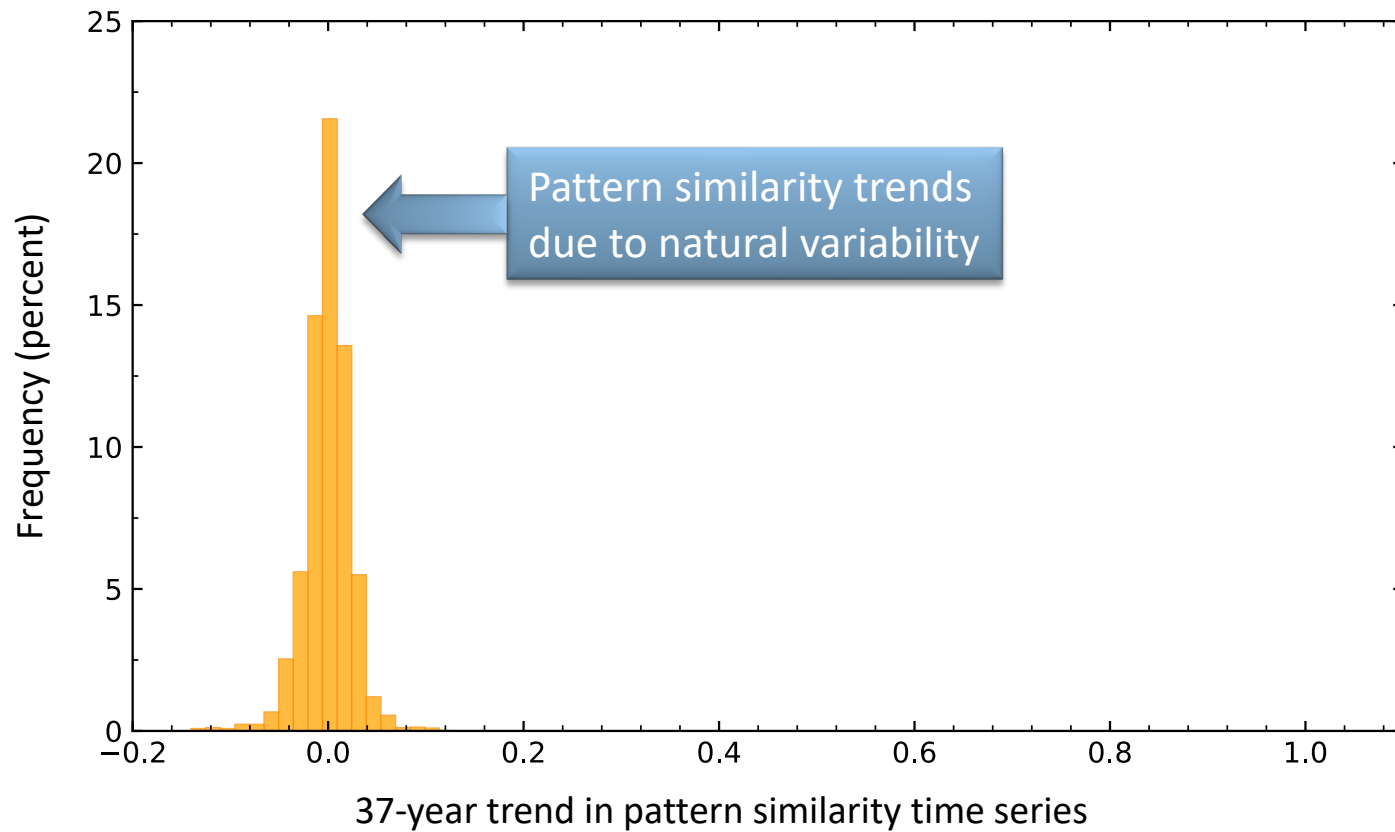

# Fingerprinting explained

Similarity between human fingerprint and satellite observations

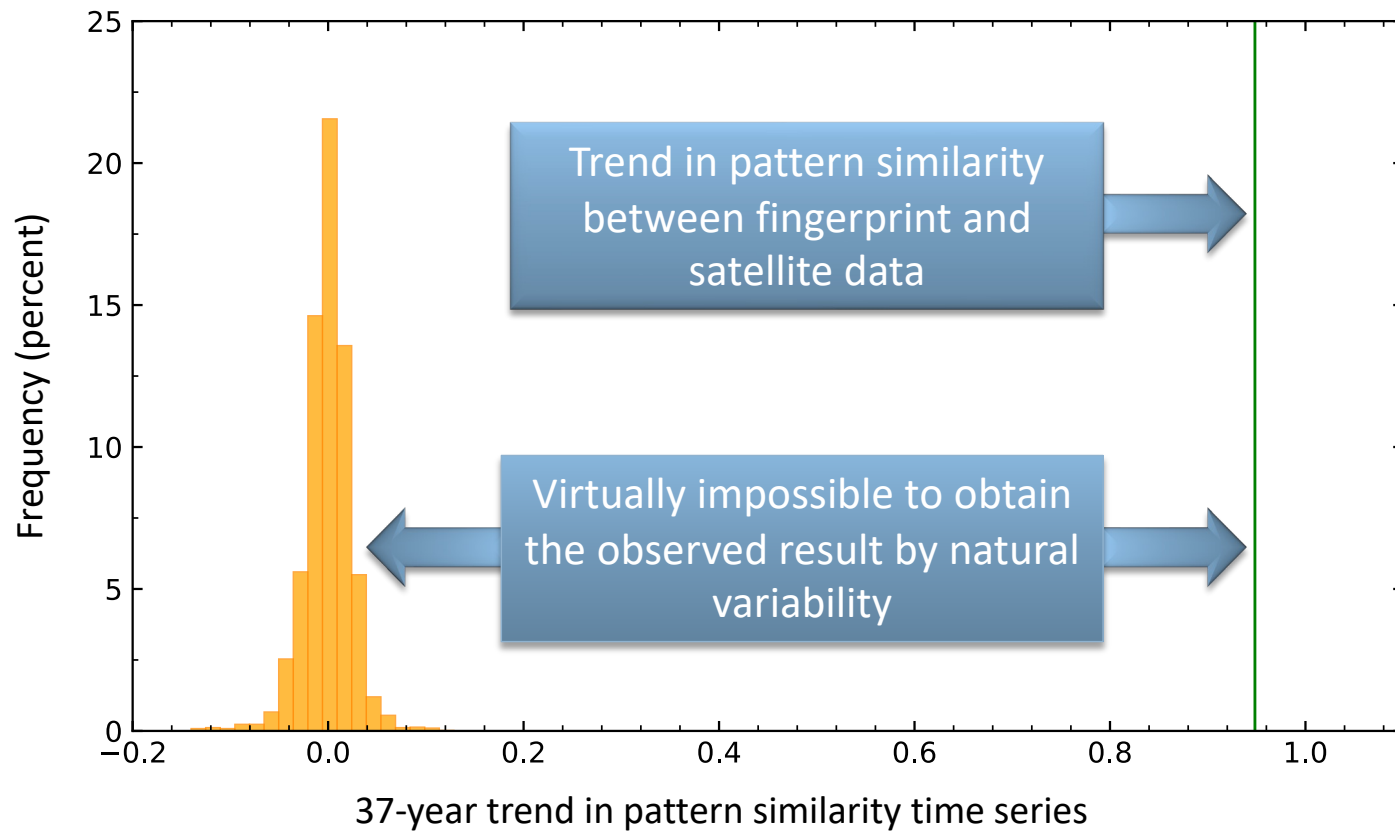

— 37-year trend in pattern similarity

# Fingerprinting explained

# Fingerprinting explained

# Other evidence against “the Sun explains all surface warming” hypothesis

# Fingerprinting is performed with many “observables”

- Climate scientists have identified human fingerprints in many different aspects of the climate system – not just in temperature

Temperature

Atmospheric Circulation

Hydrological Cycle

Snow and Ice

- Changes in different climate variables are physically and internally consistent, and are independently monitored with a range of instruments

# Ubiquitous and unequivocal human fingerprints

## Identification of human-induced changes in atmospheric moisture content

# Structure

---

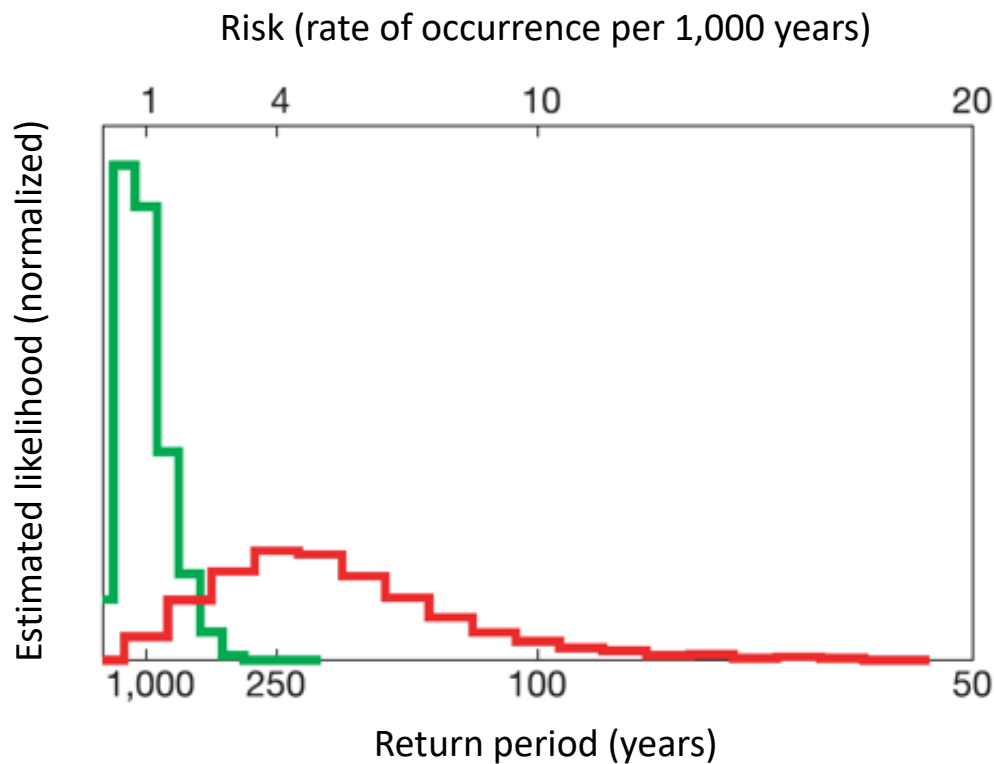

- Climate fingerprinting 101
- Fingerprinting and the 2021 Nobel Physics Prize
- Fingerprinting example
- **Looking at the causes of changes in extreme events**
- Lessons learned

# The 2003 European summer heatwave

- July and August 2003
- Health crises in several countries
- Estimated death toll: 72,000\*

# The 2003 European summer heatwave

**Histogram of return periods without human-caused climate change**

**Histogram of return periods with human-caused climate change**

“We estimate it is very likely (confidence level >90%) that human influence has at least doubled the risk of a heatwave exceeding this threshold magnitude.”

# Hurricane Harvey (2017)

---

- Category 4 hurricane
- Landfall: August 2017
- \$125 billion in damages
- More than 100 deaths
- Peak rainfall: > 60 inches in 4 days

**“...anthropogenic climate change likely increased Hurricane Harvey’s total rainfall by at least 19% with a best estimate of 38%” (Risser and Wehner, 2017)**

# Wildfires in California

**“...nearly all of the increase in burned area over the past half-century is attributable to anthropogenic climate change”**

# Wildfires in California

## Event attribution: Legal issues and questions

---

- Can we reliably estimate the human contribution to the extreme event's likelihood?
- In estimating this contribution, are the key uncertainties well-quantified?
- Are there reliable damage estimates for the extreme event?

# Event attribution: Legal issues and questions

# Structure

---

- Climate fingerprinting 101
- Fingerprinting and the 2021 Nobel Physics Prize
- Fingerprinting example
- Looking at the causes of changes in extreme events
- **Lessons learned**

# A life-changing event: Madrid, 1995

“The balance of evidence suggests a discernible human influence on global climate”

PALACIO DE CONGRESOS DE MADRID

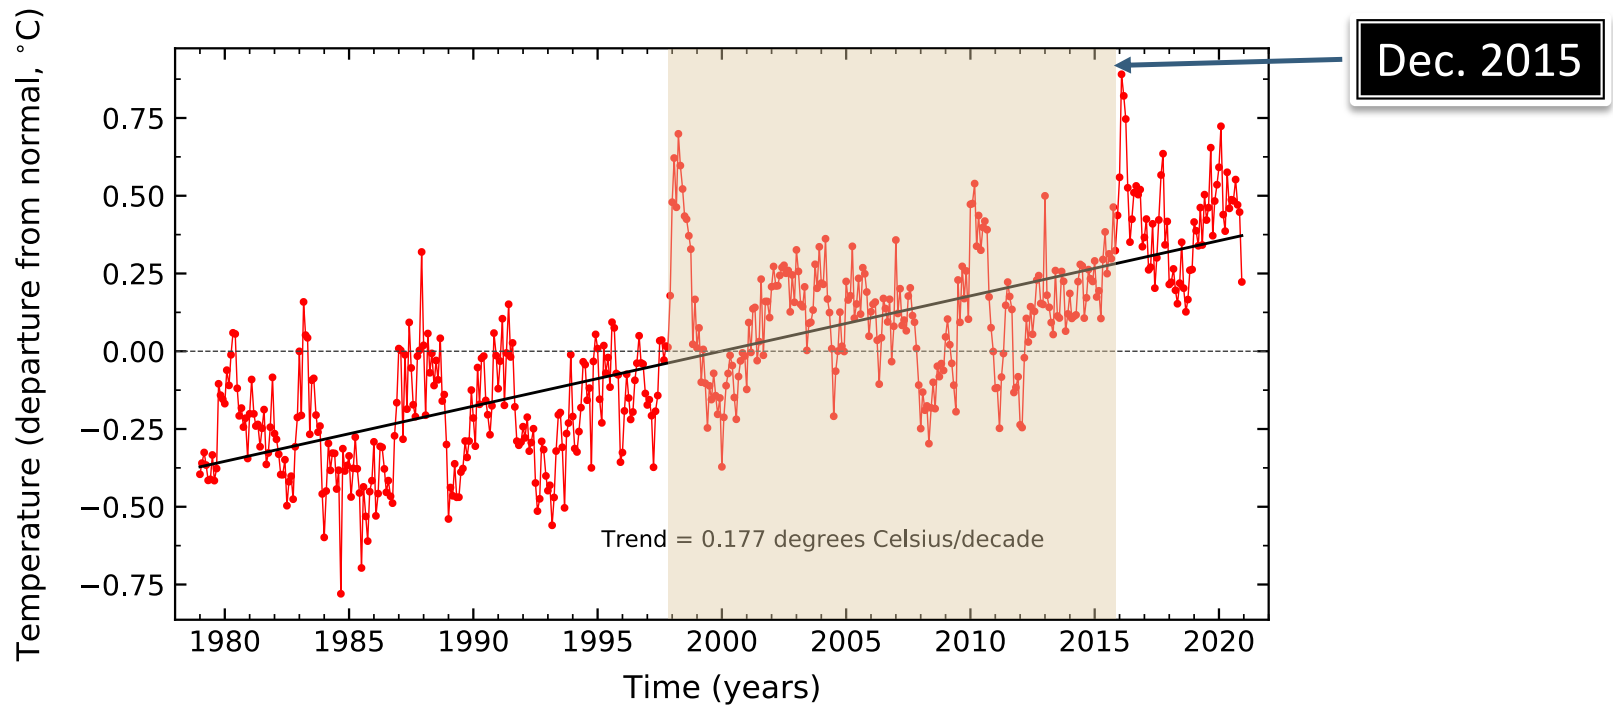

## Four lessons learned

---

1. Defend scientific understanding
2. Never engage in science by eminence of position
3. Don't just preach to the choir
4. Declare your values

# 1. Defend scientific understanding

Senator Ted Cruz, Dec. 8, 2015: “No significant global warming for the past 18 years”

NBC

PROPERTY OF NBC UNIVERSAL

## Take-home messages

---

- “Climate fingerprinting” uses pattern information to separate human and natural effects on climate
- It was developed in the late 1970s
- Human fingerprints on climate are unequivocal and ubiquitous
- Today, scientists routinely estimate the impacts of climate change on extreme events
